

Top Notch Java Developer

Who, where, what and why?

Hi there, @Betapond (Dublin & Waterford) we are an energetic mix of individuals that enjoy building innovative software solutions. We have built up a large pool of expertise in building new software systems for both start-up and established companies. We like to take on the projects that others said they couldn't build. We currently have several new clients that need us to build systems for them. We need help to get these solutions developed.

What will I be doing?

- Developing large, scalable systems in languages like Java and C++.
- Obligatory DB design & optimisation type stuff.
- Developing test suites for unit, acceptance and load testing (has to be done).
- Keep an eye on software architectures to make sure that more than two people can use systems at the same time and that nobody can break in.
- Rapidly churn out new features and new partner releases using agile, test-driven dev and very extreme programming.
- Deploy new stuff and hand it over to the implementation and support team.
- Basically, build cool stuff that loads of users like to look at and can actually use on their Mac, PC, phone or whatever device they want.
- Occasionally go out with us and let your hair down (if any).

Essential keywords – Java programmer, C++, web 2.0, development, technology, IT, software engineer, senior, experienced.

You probably won't survive unless:

- You have some proof that you spent a few years in college or university learning something related to all this.
- You have been at this game for about five years (in the real world!) or genuinely believe that you have more skills than someone who has!
- You know what we mean when we talk about distributed software architectures, and the differences between what goes in the data and logic tiers.
- You have actually written some Java code that works and know a good bit about HTML, XML/XSLT, HTTP, SSL, TCP/IP, Software patterns,.....
- You have at least heard about or read a book on Ruby, Rails, Groovy, Linux, MySQL, Mongrel, YAML, and loads of other very cool sounding technologies.
- You can prove that you really can do everything you say you can.
- You are outgoing, friendly, confident and sometimes immature.

So?

If you're at a loose end or bored in your job and your up for the challenge, best to send a CV and cover note to [an_exciting_new_life \[at\] betapond.com](mailto:an_exciting_new_life@betapond.com). If you would like some more information please give us a call on [051-306259](tel:051-306259).
